

## No special HTML

Somewhat unpredictable where breaks will happen due to browser and font differences.

```
https://  
father.com
```

```
https://  
offend.com
```

```
https://  
legend.com
```

```
https://  
nowhere.com
```

## Using WBR element (Work Break Opportunity)

Nice option to code where breaks should preferentially occur if needed.

```
https://father.com
```

```
https://offend.com
```

```
https://legend.com
```

```
https://nowhere.com
```

## Using CSS white-space: nowrap

Nice option to code where breaks SHOULD NOT occur.

```
https://  
father.com
```

```
https://  
offend.com
```

```
https://  
legend.com
```

```
https://  
nowhere.com
```

## Using &ZeroWidthSpace;

Like WBR but if user does a copy and paste of text, the ZeroWidthSpace will get included as a non-ASCII character (with Firefox and Chromium).

```
https://  
father.com
```

```
https://  
offend.com
```

```
https://  
legend.com
```

```
https://  
nowhere.com
```
